**APPLICATION ELEMENTS**

See MPEP Chapter 600 concerning utility patent application contents

1.  Fee Transmittal Form (e.g., PTO/SB/17)  
(Submit an original, and a duplicate for fee processing)

2.  Specification [Total Pages 25]  
(preferred arrangement set forth below)  
 - Descriptive title of the Invention  
 - Cross References to Related Applications  
 - Statement Regarding Fed sponsored R&D  
 - Reference to Microfiche Appendix  
 - Background of the Invention  
 - Brief Summary of the Invention  
 - Brief Description of the Drawings (if filed)  
 - Detailed Description  
 - Claim(s)  
 - Abstract of the Disclosure

3.  Drawing(s) (35 USC d113) [Total Sheets 3]

4. Oath or Declaration [Total Pages 2]

a.  Newly Executed (original or copy)  
 b.  Copy from a prior application (37 CFR §1.63(d))  
(for continuation/divisional with Box 17 completed)

**[Note Box 5 below]**

1.  **DELETION OF INVENTOR(S)**  
Signed statement attached deleting inventor(s)  
named in the prior application.  
see 37 CFR §1.63(d)(2) and 1.33(b).

5.  Incorporation By Reference (useable if Box 4b is checked)  
The entire disclosure of the prior application, from which a copy of  
the oath or declaration is supplied under Box 4b, is considered as  
being part of the disclosure of the accompanying application and is  
hereby incorporated by reference therein

**ADDRESS TO:**

Assistant Commissioner for Patents  
Box Patent Application  
Washington, DC 20231

6.  Microfiche Computer Program (Appendix)

7.  Nucleotide and/or Amino Acid Sequence Submission  
(if applicable, all necessary)  
 a.  Computer Readable Copy  
 b.  Paper Copy (identical to computer copy)  
 c.  Statement verifying identical of above copies

564 U.S. PTO  
09/516288

**ACCOMPANYING APPLICATION PARTS**

8.  Assignment Papers (cover sheet & Documents(s))

9.  37 CFR §3.73(b) Statement (when there is an assignee)  Power of Attorney

10.  English Translation Document (if applicable)

11.  Information Disclosure Statement (IDS)/PTO-1449  Copies of IDS Citations

12.  Preliminary Amendment

13.  Return Receipt Postcard (MPEP 503)  
(Should be specifically itemized)

14.  Small Entity Statement(s)  Statement filed in prior application  
(PTO/SB/09-12) Status still proper and desired

15.  Certified Copy of Priority Document(s)  
(if foreign priority is claimed)

16.  Other:

*A new statement is required to be entitled to pay small entity fees, except where one has been filed in a prior application and is being relied upon*

**17. If a CONTINUING APPLICATION, check appropriate box and supply the requisite information below and in a preliminary amendment**

Continuation     Divisional     Continuation-in-part (CIP)

of prior application No: /

**PACKAGE DELIVERY NOTIFICATION SYSTEM AND METHOD****BACKGROUND OF THE INVENTION**

5

**FIELD OF THE INVENTION**

The present invention generally relates to delivery information systems and, in particular, to a package delivery notification system and method for reporting when a vehicle is expected to deliver a package.

10

**RELATED ART**

In providing package delivery services, a recipient of a package is not always aware when a package is being sent to the recipient. In this regard, a sender does not always inform the recipient when sending a package to the recipient via a package delivery service. Furthermore, the operator of the package delivery service usually does not provide the recipient with advanced notice of the package. Therefore, the recipient is often not aware that a package has been sent to the recipient until the package is actually delivered to the recipient.

In some situations, the sender may notify the recipient that the sender is sending a package to the recipient. However, the sender may not know or may not provide to the recipient an approximate date on which the package should arrive. Therefore, the recipient is aware that a package has been sent but is not aware of when the package should arrive.

In other situations, the sender may send a package to a recipient via a package delivery service that guarantees that the package will arrive at the premises of the recipient on a particular date. Sometimes the delivery service guarantees that the package will arrive at the recipient's premises before a particular time (*e.g.*, before noon), as well.

5 This information may be communicated to the recipient by the sender so that the recipient is aware of when (*i.e.*, the date and sometimes the approximate time period) to expect the package.

However, the recipient is not usually aware of the precise time that the package will be delivered. For example, when a package is guaranteed to be delivered before noon on a particular day, the package may arrive at any time before noon (*e.g.*, between approximately 8:30 a.m. and 12:00 p.m.), depending on the route and number of stops made by the delivery vehicle in delivering the package and other packages. Adding to the difficulty of estimating when a package may arrive, the route and number of stops made by the same delivery vehicle often changes from day-to-day, depending on the 15 destinations of each of the packages delivered by the delivery vehicle.

In addition, in some cases, the delivery service may fail to meet its guarantee and may deliver the package after the specified time period. The delivery service often does not contact the recipient when the package does not arrive on time, and the recipient, therefore, is usually not aware of the failure in delivery until the specified time period has 20 expired.

Furthermore, it is also possible for the delivery service to deliver the package before its guaranteed delivery time and/or date. For example, a package sent via a two day delivery service may actually arrive at the package's destination a day early. In such

a situation, the recipient may not be available to receive the package, since the recipient may not be expecting the package until the next day. As a result, the recipient does not receive the package at the earliest possible time, and/or the package may be left unattended at the recipient's premises until discovered by the recipient.

5        Thus, a heretofore unaddressed need exists in the industry for providing a delivery system and method of reporting package deliveries and of more precisely notifying a recipient of when to expect delivery of a package.

### SUMMARY OF THE INVENTION

10       The present invention overcomes the inadequacies and deficiencies of the prior art as discussed hereinbefore. Generally, the present invention provides a package delivery notification system and method for reporting impending package deliveries and for precisely notifying a recipient of when to expect delivery of a package.

15       In architecture, the package delivery notification system of the present invention utilizes memory, a communications device, and a system manager. Package data identifying a package that is to be delivered to a recipient is stored in the memory. The package data indicates that the recipient is to receive the package and indicates the expected time that the package is to be delivered. When the package is assigned to a vehicle that will deliver the package to a premises of the recipient, the system manager  
20       transmits, via the communications device, a notification message to the recipient. The notification message preferably indicates the approximate time that the package is expected to arrive.

In accordance with another feature of the present invention, the package data indicates the order in which deliver vehicle is to deliver a plurality of packages assigned to it. The system manager can precisely determine the time period that each package is to be delivered based on the order of delivery. Therefore, the time period indicated by the 5 notification message is more precise and accurate.

The present invention can also be viewed as providing a method for reporting vehicle deliveries. The method can be broadly conceptualized by the following steps: receiving a plurality of packages; assigning each of the packages to a vehicle; determining an order that the vehicle is to deliver the packages; determining, based on the order, a first 10 time period that the vehicle is expected to deliver one of the packages to a recipient; causing a notification message to be transmitted to the recipient based on the determining a first time period step; indicating the first time period via the notification message; simultaneously transporting each of the packages via the vehicle; and transporting the one package to a premises of the recipient via the vehicle.

15 Other features and advantages of the present invention will become apparent to one skilled in the art upon examination of the following detailed description, when read in conjunction with the accompanying drawings. It is intended that all such features and advantages be included herein within the scope of the present invention and protected by the claims.

20

#### **BRIEF DESCRIPTION OF THE DRAWINGS**

The invention can be better understood with reference to the following drawings. The elements of the drawings are not necessarily to scale relative to each other, emphasis

instead being placed upon clearly illustrating the principles of the invention. Furthermore, like reference numerals designate corresponding parts throughout the several views.

FIG. 1 is a block diagram illustrating a package delivery notification system in accordance with the present invention.

5 FIG. 2 is a block diagram illustrating a computer system implementing a base station depicted in FIG. 1.

FIG. 3 is a flow chart illustrating the architecture and functionality of a system manager depicted in FIG. 2.

#### DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

10 FIG. 1 depicts a package delivery notification system 10 in accordance with the preferred embodiment of the present invention. In general, the present invention includes a base station 15 that transmits a notification message to a recipient communications device 18 at a recipient's premises 21 the day that a recipient at premises 21 is to receive a package 25. The message is preferably transmitted after the package 25 is assigned to a particular delivery vehicle 27, which delivers the package 25 to premises 21, and the message preferably includes a precise time period in which the package 25 is expected to be delivered at premises 21.

15 The operation of the base station 15 is preferably controlled by a system manager, which can be implemented in software, hardware, or a combination thereof. In the preferred embodiment, as illustrated by way of example in FIG. 2, the system manager 30 of the present invention along with its associated methodology is implemented in software and

stored in computer memory 32 of a computer system 34 along with a vehicle schedule 37, which will be described in more detail hereinafter.

Note that the system manager 30, when implemented in software, can be stored and transported on any computer-readable medium for use by or in connection with an

5 instruction execution system, apparatus, or device, such as a computer-based system, processor-containing system, or other system that can fetch the instructions from the instruction execution system, apparatus, or device and execute the instructions. In the context of this document, a “computer-readable medium” can be any means that can contain, store, communicate, propagate, or transport the program for use by or in

10 connection with the instruction execution system, apparatus, or device. The computer readable medium can be, for example but not limited to, an electronic, magnetic, optical, electromagnetic, infrared, or semiconductor system, apparatus, device, or propagation medium. More specific examples (a nonexhaustive list) of the computer-readable medium would include the following: an electrical connection (electronic) having one or

15 more wires, a portable computer diskette (magnetic), a random access memory (RAM) (magnetic), a read-only memory (ROM) (magnetic), an erasable programmable read-only memory (EPROM or Flash memory) (magnetic), an optical fiber (optical), and a portable compact disc read-only memory (CDROM) (optical). Note that the computer-readable medium could even be paper or another suitable medium upon which the program is

20 printed, as the program can be electronically captured, via for instance optical scanning of the paper or other medium, then compiled, interpreted or otherwise processed in a suitable manner if necessary, and then stored in a computer memory. As an example, the

system manager 30 may be magnetically stored and transported on a conventional portable computer diskette.

The preferred embodiment of the computer system 34 of FIG. 2 comprises one or more conventional processing elements 38, such as a digital signal processor (DSP), that communicate to and drive the other elements within the system 34 via a local interface 41, which can include one or more buses. Furthermore, an input device 44, for example, a keyboard or a mouse, can be used to input data from a user of the system 34, and an output device 47, such as a display screen or a printer, can be used to output data to the user. A disk storage mechanism 52 can be connected to the local interface 41 to transfer data to and from a nonvolatile disk (*e.g.*, magnetic, optical, *etc.*). The system 34 can be connected to a network interface 55 that allows the system 34 to exchange data with a network 58.

The system 34 also includes a base station communications device 61 that may be used to transmit notification messages to the recipient communications device 18 (FIG. 1). As shown by FIG. 1, the notification messages may be transmitted via a network 63, such as the publicly switched telephone network (PSTN) or Internet, for example, to recipient communications device 18. Base station communications device 61 may be a telephone so that the notification message may be transmitted via a telephone call or a page.

Alternatively, the communications device 61 may be a modem capable of transmitting the notification message as an e-mail message or other type of modem transmitted message. Other types of devices in other embodiments may be suitable for implementing the base station communications device 61. The recipient communications device 18, similar to the base station communications device 61, may be implemented via different types of devices, depending on the type of communication used to communicate the notification message.

The system 34 (FIG. 2) also includes a database 65. The database 65 may have a plurality of entries, wherein each entry includes data associated with a particular package 25 that is to be delivered to a particular premises 21. Each entry preferably includes sufficient data to identify the package 25 associated with the entry, as well as the premises 21 that the package 25 is to be delivered. As an example, the entry associated with a particular package 25 may include a package identifier, which has a value unique to the package 25. The entry may also include data to identify the premises 21 at which the package 25 is to be delivered. For example, the entry may include data defining the address of the premises 21. The entry may also include other data pertinent to the delivery of the package 25. As an example, the entry may include data defining the sender's name and/or address, data defining billing information, data defining the recipient's name, data defining the weight of the package 25, *etc.*

At some point, the package 25 should be assigned to a particular vehicle 27, which is to deliver the package 25 to the premises 21. Other packages 25 may also be assigned to the same vehicle 27 to deliver the other packages 25 at other premises 21. A vehicle schedule 37 (FIG. 2), defining which packages 25 have been assigned to the vehicle 27 for delivery during the same delivery period (e.g., during the same day), is preferably created and stored in memory 32, although the vehicle schedule 37 may be stored in another location, such as database 65, for example.

The vehicle schedule 37 preferably indicates at least which packages 25 are assigned to the vehicle 27 shown by FIG. 1 and indicates the premises 21 at which each of the packages 25 is to be delivered. As a result, the vehicle schedule 37 can be analyzed to determine which packages 25 are to be delivered by a particular vehicle 27 and where each

of these packages 25 is to be delivered. When the system 10 is associated with a plurality of vehicles 27, there may be a plurality of vehicle schedules 37 respectively corresponding with the plurality of vehicles 27. Therefore, each vehicle 27 corresponds to a vehicle schedule 37 that indicates which packages 25 have been assigned to the vehicle 27 for

5 delivery.

The vehicle schedule 37 may also indicate the order in which the vehicle 27 is scheduled to deliver each of the packages 25 or set of packages 25. Furthermore, vehicle schedule 37 may also define the approximate respective time that the vehicle 27 is expected to deliver each of the packages 25. Since the order of delivery is known, it is possible to predict the time period in which each package 25 is to be respectively delivered with a relatively high degree of precision and accuracy.

The vehicle schedule 37 also includes contact information that may be used to establish communication with the recipient communications devices 18. As an example, when the communications device 18 is a telephone or a pager, the contact information preferably defines a phone number that may be used to establish a telephone call with the device 18. In another example, when the communications device 18 is a computer modem designed to communicate e-mail messages, the contact information defines the e-mail address of the device 18. Therefore, the vehicle schedule 37 not only includes information defining when the vehicle 27 is expected to deliver each package 25 but also includes contact information that enables the base station communications device 61 to establish communication with the recipient communications device 18.

There are various methodologies that may be employed to create or to otherwise define the data in the vehicle schedule 37. For example, a human operator may assign a

plurality of packages 25 to a particular vehicle 27 and estimate the time at which each of the packages 25 will be delivered based on the order of delivery, as determined by the human operator. Then, the human operator may enter the aforementioned data into the system 34 via input device 44 to create the vehicle schedule 37.

5        In another embodiment, the foregoing functionality may be performed by the system manager 30 stored in memory 32. In this regard, the system manager 30 may be configured to analyze the data stored in database 65 and to automatically assign a plurality of packages 25 to the vehicle 27 based on the data stored in database 65 (e.g., based on the locations of the scheduled deliveries). Then, the system manager 30 may be designed to determine an order of delivery based on the locations of the premises 21 that are to receive the packages 25 presently assigned to the vehicle 27, and the system manager 30 may also estimate the time that each package 25 will be delivered based on a variety of factors, such as the order of delivery, the distance between delivery locations, the amount of time required to make past deliveries to the same or nearby locations, *etc.* Moreover, any technique or combinations of techniques may be employed to create vehicle schedule 37 without departing from the principles of the present invention. U.S. patent application entitled “Base Station Apparatus and Method for Monitoring Travel of a Mobile Vehicle,” assigned serial no. 09/395,501, and filed on September 14, 1999, which is incorporated herein by reference, describes in more detail techniques for creating a vehicle schedule 37.

10      15      20

      In addition, a scanner 67 may be utilized in determining which packages 25 are assigned to which vehicles 27. In this regard, packages 25 may be scanned as they are being loaded onto a particular vehicle 27 to determine which packages 27 are assigned to the vehicle 27. For example, each package 25 may include a label having a bar code or other

machine-readable markings that identify the package 27. To load a vehicle 27 with packages 25, the packages 25 assigned to the vehicle 27 on a particular day are usually grouped together and loaded onto the vehicle 27 during a loading period. The labels of the packages 25 grouped together for loading may be scanned by a scanner 67 that identifies the 5 packages based on the information scanned from the labels. Alternatively, the label of each package 25 being loaded onto the vehicle 27 may be scanned by the scanner 67 to identify the packages 25 loaded onto the vehicle 27, or the labels of the packages 25 may be scanned after the packages 27 have been loaded onto the vehicle 27. Each of the foregoing package 10 25 scanned by the scanner 67 is assumed to be assigned to the vehicle 27. Information identifying the vehicle 27 and each package 25 assigned to the vehicle 27 is transmitted from the scanner 67 to the system manager 30, when the scanner 67 is interfaced with the computer system 34, as shown by FIG. 2. The system manager 30 then stores this information in the vehicle schedule 37, as appropriate, to indicate which packages 25 have been assigned to vehicle 27 for delivery.

15 The system manager 30 is configured to analyze the vehicle schedule 37 and to transmit a notification message to the recipient communications device 18 indicating when the vehicle 27 is expected to deliver a package 25 to the recipient's premises 21, as determined from the vehicle schedule 37. Therefore, the notification message informs the recipient at premises 21 that he or she is to receive a package 25 and informs the recipient 20 of when he or she is expected to receive the package 25. The time provided to the recipient is more precise and accurate than times conventionally provided to recipients, since the time indicated in the vehicle schedule 37 takes into account the order of deliveries that the vehicle 27 is scheduled to make on the day of the package delivery.

As previously indicated, it is possible for the system 10 to report the delivery for a plurality of vehicles 27. In this regard, a vehicle schedule 37 for each vehicle 27 is created and stored in memory 32. The system manager 30 then analyzes each vehicle schedule 37, according to the techniques described herein, and transmits a notification message to each 5 recipient that is scheduled to receive a package 25 during a particular time period (e.g., on the same day).

It should be noted that it is not necessary for the system manager 30 to base the notification messages on the order that the vehicle 27 is scheduled to deliver packages 25. For example, in another embodiment, the system manager 30 can be configured to analyze 10 the data in database 65 to determine which packages 25 are scheduled to be delivered during a particular time period (e.g., on the same day) and to transmit notification messages for these packages 25. However, since the system manager 30 does not utilize the order of deliveries, as in the preferred embodiment, the time of delivery indicated by the notification messages is less precise. Consequently, each recipient is automatically warned of each 15 impending delivery that is to occur during the particular time period but is not necessarily provided with a relatively precise indication of when each delivery will occur during the particular time period.

It should be further noted that the present invention has been described herein as providing notification messages to notify users of impending arrivals of packages 25. 20 However, it is possible for the present invention to be utilized, as described herein, to notify users of impending pick-ups by vehicles, if desired. For example, the present invention may be utilized to notify a user when a vehicle 27 is scheduled to pick-up an item at a particular location.

Furthermore, it should also be noted that system manager 30 may be configured to automatically transmit a notification message to communications device 18 in response to an event that indicates when a package 25 is assigned to a vehicle 27. For example, when the label of a package 25 is scanned by scanner 67, as described hereinbefore, and when

5 data indicating that a package 25 is assigned to a particular vehicle 27 is transmitted to the system manager 30 via scanner 67, the system manager 30 may be configured to transmit a notification message in response to the foregoing data. In this regard, the system manager 30 may retrieve contact information associated with the package 25 from database 65 and utilizes the retrieved contact information to transmit a notification message to the

10 communications device 18. Alternatively, the system manager 30 may transmit the notification message in response to other events that may indicate that the package 25 has been assigned to a vehicle. For example, when an operator enters data into the system 34 via input device 44 indicating that a package 25 has been assigned to a particular vehicle 27, the system manager 30, in response to this data, may transmit a notification message to the

15 communications device 18 associated with the recipient that is to receive the package 25.

Once a package 25 is assigned to a particular vehicle 27 for delivery on a particular date and/or at a particular time, it is likely that the package 25 will be delivered at the particular time (e.g., on a particular date). Therefore, in many delivery systems 10, the estimated time of delivery for a package 25 that has already been assigned to a vehicle 27 is more likely to be correct than an estimated date and/or time of delivery for a package that has yet to be assigned to a vehicle 27. By transmitting the notification message after detecting that the corresponding package 25 has been assigned to a vehicle 27, the accuracy of the notification messages may be improved.

In addition, once the vehicle 27 begins traveling its delivery route, the system manager 30 can be configured to track the vehicle 27 and to transmit another notification message to the recipient's communications device 18, when the vehicle 27 is within a predefined proximity (e.g., distance or time) of the premises 21. U.S. Patent Application 5 entitled "Advance Notification System and Method Utilizing a Computer Network," assigned serial no. 08/852,119, and filed on May 6, 1997, and U.S. Patent No. 5,400,020, which are both incorporated herein by reference, describes in more detail how the vehicle 27 may be so tracked by the system manager 30 based on signals transmitted from the vehicle 27 and how such a notification message may be transmitted.

10 It should be further noted that the contact information may be provided from any source. For example, the sender may provide the contact information, which is then entered into the system 34. Alternatively, the contact information may be provided by the recipient. For example, a web page may be established by the operator of the system 34 that enables users, including recipients, to provide the contact information needed to establish communication with communications device 18. Therefore, if the recipient 15 would like to receive notice of when a package 25 should be delivered to the recipient, the recipient may utilize the web page via conventional techniques to submit the necessary contact information, which is then provided to system 34 via network interface 55. Furthermore, the contact information may be retained for future deliveries. For 20 example, the contact information may be permanently stored in database 65 along with the recipient's address or other information that uniquely identifies the recipient. Whenever a package 25 is destined for the user, the system manager 30 can then analyze the database 65 to determine the contact information for the recipient.

## OPERATION

The preferred use and operation of the package delivery notification system 10 and associated methodology are described hereafter with reference to FIG. 3.

5 Assume for illustrative purposes that a sender utilizes a delivery service to send at least one package 25 to a recipient at the recipient premises 21 shown by FIG. 1. The sender may provide an operator of the delivery service with the address of the premises 21 and preferably the contact information necessary to establish communication with the recipient communications device 18. However, as previously indicated, the contact 10 information may be provided by the recipient or other source. As shown by block 72 of FIG. 3, the delivery service via a human operator or system manager 30 assigns a package identifier to the package 25 and stores the package identifier and the information provided by the sender into an entry in the database 65.

At some point, the package 25 is assigned to a particular vehicle 27 that is to 15 deliver the package 25 to the premises 21 on a particular day, as depicted by blocks 75 and 78. The vehicle 27 may be assigned other packages 25 to deliver to other premises 21. Based on the packages 25 to be delivered by the vehicle 27 on the particular day (or some other time period), the vehicle schedule 37 is produced in block 81. The vehicle 20 schedule 37 includes data that defines which packages 25 are to be delivered by the vehicle 27 on the particular day (or some other time period), when these packages 25 are expected to be delivered, and the contact information necessary to establish communication with the recipient communications devices 18 associated with the

recipients that are to receive a package 25 from the vehicle 27 on the particular day (or other time period).

As an example, assume that the package 25 provided by the aforementioned sender is scheduled to be the third package 25 to be delivered by the vehicle 27. Based 5 upon the package's order of delivery, the approximate time of delivery of the package 25 is determined and stored in memory 32, as shown by block 83. For example, it may be assumed that each delivery will take fifteen minutes on the average. Therefore, the delivery of the foregoing package 25 is expected to occur approximately forty-five minutes after the vehicle 27 begins its delivery route. Assuming that the vehicle 27 is 10 scheduled to begin its delivery route at approximately 9:00 a.m., the time in vehicle schedule 37 indicating the time of delivery of the foregoing package 25 should be defined as 9:45 a.m. Alternatively, a margin of error of ten minutes, for example, could be factored in such that the time of delivery of the foregoing package 25 could be defined in 15 vehicle schedule 37 as between approximately 9:35 a.m. and approximately 9:55 a.m.

15 In other embodiments, other factors could be accounted for. For example, instead of using an average time for each delivery, the time of each delivery could be estimated based on the order of delivery and the distances between successive deliveries. Furthermore, expected traffic conditions (e.g., congested or non-congested) or other 20 factors could be considered to make the estimates more accurate. In any event, the time of delivery indicated by the vehicle schedule 37 is based on the expected order of deliveries that the vehicle 27 is expected to make in delivering the assigned packages 25.

Once the vehicle schedule 37 is defined, the system manager 30 transmits a notification message in block 85 of FIG. 3 to each recipient that is expected to receive a

delivery from the vehicle 27. Therefore, the communications device 18 at the premises 21 receives a notification message and interfaces the notification message with the recipient. By analyzing the notification message, the recipient is aware that a package 25 is being delivered to the recipient and is aware of the approximate time that the package 5 25 should arrive at the premises 21.

In the preferred embodiment, the notification messages for the packages 25 to be delivered by the vehicle 27 on the same day are transmitted to the recipients on the day that the vehicle 27 is to make the deliveries. However, the notification messages may be transmitted at other times, if desired. Furthermore, the vehicle schedule 37 has been 10 described hereinabove as defining the deliveries that are to be made by the vehicle 27 on a particular day. However, the vehicle schedule 37 may be used to define the deliveries that are to be made by the vehicle 27 for other time periods, if desired.

It should be noted that, in the preferred embodiment, the system manager 30 performs each of the steps depicted by FIG. 3. However, it is not necessary for the 15 system manager 30 to perform each of these steps, and it is possible for some of the steps to be performed by other devices and/or by a human operator. For example, it is possible for a human operator and/or another device to perform blocks 72, 75, 78, and 81 while the system manager 30 performs blocks 83 and 85. In other embodiments, other combinations are possible.

20 In addition it is possible to omit block 83. For example, a notification message could be transmitted to the communications device 18 of each recipient that is to receive at least one of the packages 25 that is assigned to a particular vehicle 27 in block 78. Therefore, once a package 25 is assigned to a particular vehicle 27, a notification message

identifying approximately when the package 25 should arrive at the recipient's premises  
21 is transmitted to the recipient. It is not necessary for the time indicated by the  
notification message to be based on the order of deliveries that the vehicle 27 is expected  
to make.

5        It should be emphasized that the above-described embodiments of the present  
invention, particularly, any "preferred" embodiments, are merely possible examples of  
implementations, merely set forth for a clear understanding of the principles of the  
invention. Many variations and modifications may be made to the above-described  
embodiment(s) of the invention without departing substantially from the spirit and  
10      principles of the invention. All such modifications and variations are intended to be  
included herein within the scope of the present invention and protected by the claims.

**CLAIMS**

Now, therefore, the following is claimed:

1       1. A system for reporting impending vehicle deliveries, comprising:

2               memory storing a vehicle schedule, said vehicle schedule identifying packages

3       that are to be delivered by a vehicle during a first time period and indicating an order that

4       said vehicle is expected to deliver said packages;

5               a first communications device configured to establish communication with

6       remote communications devices; and

7               a system manager configured to analyze said vehicle schedule and to determine,

8       based on said order, a second time period that said vehicle is expected to deliver one of

9       said packages, said system manager further configured to transmit a notification message

10      via said first communications device, said notification message identifying said second

11      time period,

12               wherein said second time period is within said first time period.

1       2. The system of claim 1, wherein said notification message is an e-mail

2      message.

1       3. The system of claim 1, wherein said first time period is a day.

1           4.     The system of claim 1, wherein said vehicle schedule identifies each  
2     recipient that is to receive at least one of said packages, said notification message  
3     identifying each of said packages to be received by one of said recipients during said first  
4     time period.

1           5.     A system for reporting impending vehicle deliveries, comprising:  
2                 memory storing package data identifying a plurality of packages that are to be  
3     respectively delivered to a plurality of recipients;  
4                 a first communications device configured to establish communication with  
5     remote communications devices; and  
6                 a system manager configured to detect when one of said packages has been  
7     assigned to a vehicle for delivery to one of said recipients, said system manager further  
8     configured to transmit a notification message via said first communications device in  
9     response to a detection that said one of said packages has been assigned to said vehicle.

1           6.     The system of claim 5, further comprising a scanner configured to scan a  
2     label of said one package and to identify said one package based on said label, wherein  
3     said system manager detects that that said package has been assigned to said vehicle  
4     based on whether said scanner has identified said one package.

1           7.     The system of claim 5, wherein said notification message is an e-mail  
2     message.

1           8.       The system of claim 5, wherein said package data indicates whether said  
2       one package has been assigned to said vehicle and said system detects when said one  
3       package has been assigned to said vehicle by analyzing said package data.

1           9.       The system of claim 5, wherein said notification message identifies a  
2       sender of said one package.

1           10.      The system of claim 5, wherein said package data indicates that said  
2       packages are to be delivered by said vehicle and indicates an order that said vehicle is  
3       expected to deliver said packages, and wherein said system manager is further configured  
4       to determine, based on said order, that said one package is expected to be delivered  
5       during a particular time period, said notification message indicating that said one package  
6       is expected to be delivered during said particular time period.

1           11.      The system of claim 5, wherein said system manager is further configured  
2       to determine when said vehicle is within a predefined proximity of a premises of said one  
3       recipient based on signals transmitted from said vehicle, said system manager further  
4       configured to transmit a second notification message when said vehicle is within said  
5       predefined proximity.

1       12. A method for reporting impending vehicle deliveries, comprising the steps  
2       of:

3       receiving a plurality of packages;

4       assigning each of said packages to a vehicle;

5       determining an order that said vehicle is to deliver said packages;

6       determining, based on said order, a first time period that said vehicle is expected

7       to deliver one of said packages to a recipient;

8       causing a notification message to be transmitted to said recipient based on said

9       determining a first time period step;

10       indicating said first time period via said notification message;

11       simultaneously transporting each of said packages via said vehicle; and

12       transporting said one package to a premises of said recipient via said vehicle.

1       13. The method of claim 12, further comprising the step of transmitting said  
2       notification message via an e-mail message.

1       14. The method of claim 12, further comprising the steps of:

2       determining whether each of said packages is expected to be delivered during a  
3       second time period; and

4       performing said assigning step based on said determining whether step,  
5       wherein said first time period is within said second time period.

1       15. The method of claim 14, wherein said second time period is a day.

1       16. A method for reporting impending vehicle deliveries, comprising the steps  
2       of:

3           receiving a package for delivery to a premises of a recipient;  
4           assigning said package to a vehicle;  
5           detecting when said package is assigned to said vehicle;  
6           producing a notification message in response to said detecting step, said  
7       notification message indicating a time period in which said package is expected to be  
8       delivered at said premises;  
9           transmitting said notification message to a communications device located at said  
10      premises; and  
11       transporting said package to said premises via said vehicle.

1       17. The method of claim 16, further comprising the step of scanning a label of  
2       said package, wherein said detecting step further includes the step of detecting said  
3       scanning step.

1       18. The method of claim 16, further comprising the steps of:  
2           storing data indicating whether said package is assigned to a vehicle;  
3           analyzing said data; and  
4           performing said detecting step based on said analyzing step.

1           19. The method of claim 16, wherein said notification message is an e-mail  
2        message.

1           20. The method of claim 16, further comprising the steps of:  
2        determining when said vehicle is within a predetermined proximity of said  
3        premises; and  
4        transmitting a second notification message in response to said determining step.

1           21. The method of claim 16, further comprising the step of indicating, via said  
2        notification message, a sender of said package.

1           22. The method of claim 16, further comprising the step of indicating, via said  
2        notification message, a weight of said package.

1           23. The method of claim 16, further comprising the steps of:  
2        maintaining a web page;  
3        receiving contact information via said web page; and  
4        utilizing said contact information to perform said transmitting step.

**ABSTRACT OF THE DISCLOSURE**

A package delivery notification system reports impending package deliveries and precisely notifies recipients of when to expect the deliveries. The package delivery notification system utilizes memory, a communications device, and a system manager.

5      Package data identifying a package that is to be delivered to a recipient is stored in the memory. The package data indicates that the recipient is to receive the package and indicates the expected time that the package is to be delivered. When the package is assigned to a vehicle that will deliver the package to a premises of the recipient, the system manager transmits, via the communications device, a notification message to the recipient. The notification message preferably indicates the approximate time that the package is expected to arrive.

## FIG. 1

**FIG. 2**

**FIG. 3**

## DECLARATION FOR PATENT APPLICATION

Attorney Docket No: **050711-1060**

As the below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am an original, first and sole inventor of the subject matter which is claimed and for which a patent is sought on the invention entitled **PACKAGE DELIVERY NOTIFICATION SYSTEM AND METHOD**, the specification of which:

is attached hereto.

was filed on \_\_\_\_\_ as Application Serial No. \_\_\_\_\_.

was filed on \_\_\_\_\_ under U.S. Express Mail No. \_\_\_\_\_.

is set forth in PCT International Application No. \_\_\_\_\_; filed on \_\_\_\_\_ and as amended Under PCT Article 19 on \_\_\_\_\_ (if any).

I/we hereby state that I/we have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I/we acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, §1.56.

I/we hereby claim the benefit under Title 35, United States Code, §119 of any United States provisional patent application, foreign application(s) for patent or inventor's certificate listed below and have also identified below any United States provisional patent application, foreign application for patent or inventor's certificate having a filing date before that of the above-identified application on which priority is claimed: **NOT APPLICABLE**.

I/we hereby claim the benefit under Title 35, United States Code, §120 of any United States patent application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, §112, I/we acknowledge the duty to disclose material information as defined in Title 37, Code of Federal Regulations, §1.56 which occurred between the filing date of the prior application and the national or PCT international filing date of this application: **NOT APPLICABLE**.

I/we hereby appoint the following attorneys/agents to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith: **George M. Thomas, Reg. No. 22,260; James W. Kayden, Reg. No. 31,532; Scott A. Horstemeyer, Reg. No. 34,183; Stephen R. Risley, Reg. No. 35,659; Jeffrey R. Kuester, Reg. No. 34,367; Daniel J. Santos, Reg. No. 40,158; Daniel R. McClure, Reg. No. 38,962; Robert E. Stachler II, Reg. No. 36,934; David P. Kelley, Reg. No. 17,420; Michael J. Tempel, Reg. No. 41,344; Michael J. D'Aurelio, Reg. No. 40,977; David R. Risley, Reg. No. 39,345; Jon E. Holland, Reg. No. 41,077; Dan R. Gresham, Reg. No 41,805; M. Paul Qualey, Reg. No 43,024.**

Please address all telephone calls, in the first instance, to **Scott A. Horstemeyer** at telephone number: **(770) 933-9500**.

**Address all correspondence to:**

**Scott A. Horstemeyer  
THOMAS, KAYDEN, HORSTEMEYER  
& RISLEY, L.L.P.  
100 Galleria Parkway, N.W., Suite 1750  
Atlanta, Georgia 30339-5948**

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statement and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
